Re: HB 2601

Dear Education Committee Members,

I am just another mother, wife, daughter and nurse asking that you support Representative Huebert's bill, HB 2601 (School Immunizations).

I graduated nursing school in 2011 and have worked in several different fields. I believed in vaccines until my 2nd child was effected. The large red lump was just a superficial reaction, but systemically it caused behavioral damage that I wish we could undo.

Honestly, vaccines were never on my radar as a concern until another nurse friend of mine asked that I look at the ingredients in vaccines and the possible AE's that could result. It was then that I realized multiple issues, we had experienced. Since then, I have 2 unvaccinated children, 1 fully and 1 partially. Amazingly enough, my unvaccinated children have NEVER required antibiotics, have never had an ear infection, zero allergies, zero behavioral issues; unlike my fully and partially vaccinated children. Now that I have researched and read science that has been conducted and unfortunately hidden from the public's "easy" access, it is clear how our industry and government has gone above and beyond to silence the issues that make vaccines unsafe. One of my big concerns are the babies who die of SIDS just hours or days after their routine vaccinations. I personally know a mother who has been told there is no connection, but vaccines were administered the same day as her child passed away. If it were anything else, it would be highly considered as a causative issue. Please consider this amendment and understand we all want what is best for our children, and that is to protect our bodies from harmful ingredients that are KNOWN to be unsafe and have shown that by hundreds of stories hushed by censorship. Thank you.
